Dear Joshua:

We've been working out a pathway of ribose formation from phosphogluconic acid in enzyme systems. Since the enzymes go a bit further than we'd like, we end up with some pentonic acid phosphates. Although it's easy to get gluconate-adapted bugs that won't touch D-arabonate or ribonate and are excellent analytical tools, I've been unable as yet to obtain E. coli strains which can handle arabonate or ribonate. Have you by any chance, in your wandering through this bacterial swamp, run across bugs which handle these substrates? A slant of the appropriate strain would be appreciated.

What's new?

With best regards, I remain,

Sincerely yours,

Seymour
